Programming Concepts 1. Loose Coupling

1. Model View Controller My front end is very separate from my backend. I once asked my CS friend what is the biggest thing they learnt from their internship and this is what they told me, and this is what I aspired towards for this project. My data (model) is explicitly separated from the way I view them in my code, for example:

```
function onLoad() { local_cart =  
JSON.parse(localStorage.getItem("user_cart")); if (local_cart ==  
null) { localStorage.setItem("user_cart", JSON.stringify([])); }  
View_update_num_cart(); view_items_in_cart(); update_remover();  
};
```

After my model is initialized and manipulated, I simply create functions to view...() and update...() them.

2. Event Based Programming
3. Client Side Storage
4. Libraries
